an electric guitar, amplifying a string so that the string does not seem to be in tune. This pedal is generally used on a single note, and can be used to change the pitch by varying the amount of tremolo effect or overdrive. Tremolo is an effect that causes the volume of a guitar's open string to fluctuate between on and off. The amount of overdrive is controlled with the sustain function or wah-wah. Wah-wah pedal can also be used to produce a unique quack sound or a robotic sound by combining the wah-wah effect with a chorus effect. Although some wah-wah pedals have a physical foot switch, most are controlled by an integral or built-in switch on the pedal body.

History The wah-wah pedal was developed by Bill Murray, who designed and patented it in the mid-1960s. He used the effect to recreate the sound of a Hammond organ, an early '60s-era popular instrument. In 2018, Bill Murray submitted a patent application for a "wah-wah pedal" that he said could be used in a guitar. The patent was published on October 2, 2018.

Operation The pedal is typically operated by pressing the foot switch, which may be positioned directly on top of the pedal. When the

foot switch is held down, the string vibrates at a constant frequency, much like a regular wah-wah
